$$|0_{1}|^{a} \int_{0}^{2} \frac{x dx}{(1+x^{2})^{2}} = \frac{1}{2} \int_{0}^{5} \frac{du}{u^{2}} = -\frac{1}{2u} \int_{0}^{5} \frac{du}{u^{2}} = -\frac{1$$

$$(D_{y^{\pm \lambda}} \quad b) \int_{-\pi/2}^{\pi/2} \sin^6 x \cos x dx = \int_{-1}^{1} u^6 du = \frac{1}{7} u^7 \int_{-1}^{1} u = \lambda \sin x$$

$$du = \cos x dx = \frac{2}{7}$$

Problem 3. (20 points) Find the volume of the solid of revolution formed by revolving around the y-axis the region enclosed by

$$y = \cos(x^2)$$

and the x-axis (central hump, only).

$$V = \int_{0}^{2\pi} 2\pi x \cdot cos(x^{2}) dx$$

$$U = x^{2}$$

$$du = 2xdx = \pi \int_{0}^{2\pi} cos u du$$

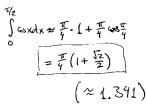

$$= \pi \int_{0}^{2\pi} cos u du$$

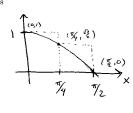

Problem 2. (20 points) Find the following approximations to

$$\int_{0}^{\pi/2} \cos x \, dx$$

(Do not give a numerical approximation to square roots; leave them alone.)

a) using the upper Riemann sum with two intervals

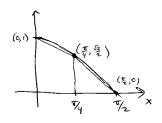

$$\int_{0}^{\sqrt{2}} \cos x dx \approx \frac{1}{2} \frac{\pi}{7} \left(1 + \frac{\sqrt{2}}{2}\right) + \frac{1}{2} \frac{\pi}{7} \cdot \frac{\sqrt{2}}{2}$$

$$= \frac{\pi}{8} \left(1 + \sqrt{2}\right)$$

$$(\approx 0.948)$$

c) using Simpson's rule with two intervals $\,$

$$\int_{0}^{\infty} 40 \times x dx \approx \frac{1}{3} \frac{\pi}{4} (1 + 4 \cos \pi + 0)$$

$$= \frac{\pi}{12} (1 + 252)$$

$$(\approx 1.002)$$

Problem 4. (20 points) Students studying for an exam get x hours of sleep in the two days leading up to the exam, where x is in the range $0 \le x \le a$. The number of students who got between x_1 and x_2 hours of sleep is given by

$$\int_{x_1}^{x_2} cx dx; \quad 0 \le x_1 \le x_2 \le a$$

کریا a) What fraction of the students got less than a/2 hours of sleep?

What fraction of the students got less than
$$a/2$$
 hours of sleep?

Total number of students = $\int_{0}^{\infty} c x dx = \frac{Ca^2}{2}$ (all students number of students of students who got between 0 and $\frac{a}{2}$ hours of sleep).

Also = $\int_{0}^{\infty} c x dx = c \frac{a^2}{8}$

Place = $\int_{0}^{\infty} c x dx = c \frac{a^2}{8}$

Place = $\int_{0}^{\infty} c x dx = c \frac{a^2}{8}$

 $\{ \text{Dyp} \text{ b) Their scores are proportional to the amount of sleep they got: } S(x) = 100(x/a). \text{ Find the (correctly weighted) average score in the class.}$

$$N = \text{Total number of pathbox} = \int_{0}^{\infty} cx \, dx = \frac{ca^{2}}{2}$$

$$Average pear = \frac{1}{N} \int_{0}^{\infty} cx \, S(x) dx = \frac{1}{N} \int_{0}^{100} c \, x^{2} dx$$

$$= \frac{1}{ca_{2}^{2}} \frac{100c}{a} \frac{a^{3}}{3} = \boxed{20}$$

$$(\pm 66.6)$$

Problem 5. (20 points) Let

$$F(x) = \int_0^x \sqrt{t} \sin t \, dt$$

a) Find F'(x) for x > 0 and identify the points $\underline{a > 0}$ where F'(a) = 0.

$$F'(x) = \sqrt{x} \sin x$$

 $F'(a) = 0$, aso, for $a = KT$ K a positive indeger.
 $(1,2,3,4,...)$

b) Decide whether F has a local maximum or minimum at the smallest critical point a > 0 that you found in part (a) by evaluating F''.

The publication point is at a = M.

The pullest critical point is at
$$a = \pi$$
.

$$F''(x) = \frac{1}{25x} \lim_{N \to \infty} x + 5\pi \cos x$$

$$F''(\pi) = \frac{1}{25\pi} \lim_{N \to \infty} \pi + 5\pi \cos \pi = -5\pi < 0.$$
So π is a flowl maximum.

Say whether F(x) is positive, negative or zero at each of the following points, and give a reason in each case.

Ipt. i)
$$x = 0$$
 $F(o) = \int_{0}^{\infty} \int$

Jet
$$t=u^2$$
, $dt=2u\,du$
 $G(x) = \int u^2 \sin(u^2) du = \int t \sin t \frac{dt}{2\sqrt{t}}$
 $= \frac{1}{2} \int \sqrt{t} \sin t \,dt = \left[\frac{1}{2} F(x^2)\right]$

church words, "there is more negative area letwern would 24 then positive area from 0 to V."
